

THREE-WAY SHUT-OFF BALL VALVE

- Three-ports configured with one at Bottom and one each on right and left side of valve with Shut-off condition.
- With this configuration; two different Medias can flow separately from either of the two-sides of the valve to the bottom side of the valve & can be stopped.
- Optionally with this same configuration; Single media can be passed from bottom side considering it as Inlet to either of the two-sides of the valve considering as two different Outlets & can also be stopped.
- Thus with a single three-way valve shut-off is also achieved.
